PROGRAMMING OF META ALARMS

MetaSystems have had their alarms installed by many manufacturers other than TVR.

Having worked with the majority of these companies, we are able to offer the same reprogramming/replacement of their alarm systems.

Examples: -

- Alfa Romeo GTV & Alfa 156
- Fiat Coupe
- Vauxhall VX220
- Lotus Elise
- Hyundai Coupe

Popular Models Installed

M99T

M99T2

Programming is available for many of the Meta alarm control units, such as : - HPA, M99T , M99T2 , M928 and M996.

For those with an M96 alarm, should the V&A not be interested, we can also reprogramme that!

Please contact us should you come across other Meta control modules, as there were a few variants within the ranges.

The various transmitters available, can be seen under our products listing.

A replacement M36T/T2 immobiliser is also available. The memory of the M99T/T2 would need clearing. This would allow the introduction of the new immobiliser, without the need of having to replace the entire alarm system. The original functionality of the alarm and immobiliser system will then be retained.

As the M99T2 is no longer available, this will give a significant saving against replacing the alarm system
